

QUESTION WORKBOOK

Centres of mass by integration

Further Mechanics 2 · Year FM

6 questions · 20 marks

PRINT EDITION

SECTION A · Warm-up

- A1** Write down the two integrals for the centre of mass of a lamina under a curve, and explain why they are not symmetric. [2]

- A2** Find the centre of mass of the uniform lamina bounded by $y = 4 - x^2$, the axes and the positive x -axis, for x from 0 to 2. [3]

SECTION B · Standard

- B1** The region under $y = \sqrt{x}$ from $x = 0$ to $x = 4$ is rotated about the x -axis. Find the centre of mass of the solid. [4]

- B2** A uniform solid hemisphere of radius r is formed by rotating $y = \sqrt{(r^2 - x^2)}$ about the x -axis for x from 0 to r . Show that its centre of mass is $3r/8$ from the flat face. [4]

- B3** Explain how the method changes for a body whose density varies with position. [3]

SECTION C · Stretch

- C1** A rod of length 2 m lying along the x -axis from the origin has density $(1 + x)$ kg per metre. Find its centre of mass. [4]
