

QUESTION WORKBOOK

Comparing two normal means

Further Statistics 2 · Year FM

6 questions · 20 marks

NAVY SCREEN EDITION

SECTION A · Warm-up

- A1** Two independent samples of size 25 come from populations with variances 50 and 30. Find the standard error of the difference of the sample means. [2]

- A2** Sample 1: $n = 36$, mean 21.4, population variance 9. Sample 2: $n = 49$, mean 19.6, population variance 16. Find the standard error of the difference and the test statistic for equal means. [3]

SECTION B · Standard

- B1** Using those samples, test at the 5% level whether the population means differ. [4]

- B2** Find a 95% confidence interval for the difference of the population means, and check it agrees with the test. [4]

- B3** Explain what changes if the population variances are unknown but both samples are large. [3]

SECTION C · Stretch

- C1** Repeat the test on the same data at the 1% level, one-tailed, with critical value 2.3263, and comment on the pair of results. [4]
